RICHIEDI MAGGIORI INFORMAZIONI

A UK software company that has an established program related to marine navigation and fishing is requesting a C++ software developer under a services agreement to provide software modification, feature development and maintenance for the existing program.

The UK software company is looking for a software program developer who has experience working on C++ programs using the Visual Studio software suite. The program has been developed to assist with marine navigation, fishing and marine conservation. The work will include modification and the addition of features within the program as required. The developer will be working on an established program that is well written with clear explanations as to how it functions. The original developer of the program will be retiring from the role, but will act as a consultant providing knowledge transfer support relating to the existing program and insight regarding the development of new features and modifications in order to improve functionality and the customer experience for the user. An understanding of the marine industry in relation to navigation and fishing would be of special interest. However, a strong technical understanding of C++ programming is most important. The UK company is requesting a service agreement with a new developer and the required assistance for maintenance and development could vary from four to forty hours a month when necessary.
