[RICHIEDI MAGGIORI INFORMAZIONI](#)

The French health company is developing a medical device using virtual reality in physical rehabilitation therapy. The innovative solution is based on space technology and can eliminate partially or totally the effect of the gravity force. The company wants to expand in Europe and is looking for distributors with access to the physical rehabilitation market.

Since 2015, the French health company is specialising in technology transfer from the space sector to address different medical issues. The company is developing an innovative device for physical rehabilitation therapies, that will allow the patient to work on the cognitive level, in virtual immersion, while moving on a fixed point, 360 degrees, partly freed his weight. The solution provides a treadmill, has an integrated monitoring software. The device facilitates some exercises, lessening or eliminating the gravity force, thus reducing the muscular effort, especially in certain exercise connected to deambulation, gait and balance: it increases the neurological control on body extremities, and allow to gradually reintroduce the gravitational effects under controlled conditions. The French health company wants to expand its sales network in Europe is looking for distributors in the field of physical rehabilitation equipment.
