RICHIEDI MAGGIORI INFORMAZIONI

A German SME developed an independent (off-grid) closed-circuit television system (CCTV) for live broadcasting, storing and transmission of visual and sonic signals. The CCTV is solar-driven and applicable for use on meteorological stations. Moreover, it may be employed for individual applications and further development. The company is looking for a distribution service agreement.

A German SME developed a CCTV system that operates upon own solar panels. For this reason, external electric power supply is not required. This self-sufficient power supply enables the system for its application on meteorological stations in areas difficult to access such as mountain tops or remote marine locations. The company is looking for a distributor for their products. Furthermore, the company intends to increase their standing on international markets for enlarging their business. The system has an integrated antifreeze protection device to assure clear pictures recorded by the CCTV. Applying radio transmission the system broadcasts visual and sonic signals to the respective operational headquarter utilising its own solar energy. For the transmission, various systems are applicable such as GPRS/UMTS/HSDPA/HSUPA/LTE/W-LAN or satellites. The autarchic solar power supply of the system is supported by accumulators for energy saving which is capable of bridging an energy gap up to three consecutive days. As an alternative to the solar panels, wind energy panels are available. The complete technical infrastructure of the CCTV is installed on and inside a pylon. The camera may be installed on a sliding carriage which optimizes assembling and maintenance. If required, the technical infrastructure may be installed in an external control box at the bottom of the mast. Therefore, the system is applicable for various purposes and new developments.
