[RICHIEDI MAGGIORI INFORMAZIONI](#)

A Spanish biotech company working in the field of in vitro diagnostic tools for precision medicine, has developed a novel kit which allows a better selection of therapies for patients involved in kidney transplantation processes. The company is growing its product portfolio, developing new selection tools for inflammatory diseases. With the launch of their first renal transplantation product, commercial agency and distribution agreements are sought in EU countries.

The Spanish biotech company founded in 2015 has successfully assembled a team of 22 professionals for the development of their solutions regarding precision medicine in vitro diagnostic tools (IVD) for chronic inflammatory conditions. With successful results in previous R&D stages, they have developed a new diagnostic device that optimizes immunosuppressive therapy for kidney transplant recipients and patients affected by autoimmune diseases. The product already patented, allows physicians to optimize each individual immunosuppressive therapy. Counting with a proprietary platform their product pipeline comprises other developments for Rheumatoid Arthritis and Lupus Nephritis in the short term, while other organs autoimmune diseases developments are considered in the mid and long terms. Considering their product commercialization strategy, internationalization plays an important role, reaching European regional markets through specialized agents has been considered one of their main objectives. Collaborations are sought preferably under commercial agreements or distribution services agreements.
