RICHIEDI MAGGIORI INFORMAZIONI

Spanish Big Data company has developed a Support Decision Tool by means of satellite imagery technology that enables farmers and agronomists to adopt precision agriculture and better control production rates and efficiency standards. The company is looking for partners from the agriculture and farming sectors with whom to work with under commercial agency agreements and/or license agreements.

The tool allows companies from the agriculture sector to centralize and integrate full management information control in a single environment, making it easier for crop managers and users to monitor, analyze and understand production tendencies, as it shows necessary key information for business intelligence and decision making. The Spanish SME, who has already worked with leading global companies, is looking for partners from the agriculture and farming advisory sectors, agriculture technology companies (AGtech), manufacturers, crop insurance bodies and agricultural funding institutions whom to work with under commercial agency or license agreements. As agronomists usually have to make difficult decisions that affects yield crops direct and indirectly the platform using satellite imagery technology makes it easier to reach a better and objective farming management decision criteria. With this tool farmers and agronomists can monitor crops with precision and therefore leverage different sources of information.
